2020 Research Report

Roger Jackson Centre for Health and Wellness Research

Human Performance Laboratory
It has been a long year. Restrictions, social distancing, wearing masks, research interrupted, courses cancelled, working from home. Like the rest of the world, life stopped for the Human Performance Lab from April to August 2020, and then recovered slowly, and as I am writing this note in the spring of 2021, we are almost back to normal. It took a special effort from all to keep trainees going and offer rich research experiences to the many undergraduate and foreign visiting students who had to work remotely for big parts of the year. The research associates of the lab were particularly resourceful, and I want to thank them all for their effort, inspiration, and flexibility. Above all, I want to thank Tim Leonard, who has looked after the HPL for more than 30 years. He was in the lab virtually every day during the pandemic, making sure we had dry ice and liquid nitrogen, the freezers were working, animals were fed and trained, collecting data for innumerable student projects, fixing the things that broke, and so much more. He provided the HPL with some much-needed normality, making sure everything worked at all times.

I worked mostly remotely from my weekend home in the Rocky Mountains, right next to the forest and wilderness, with bears and deer and elk and squirrels and cougars visiting daily. It is a quiet place, ideal for isolation in times of a pandemic. I must admit, I enjoyed the solitude, the quiet, the calm, the long days without interruptions. It provided for more time for the things I love: thinking, writing, skiing, reading, hiking, and relaxing with my favourite person. The days were flexible, and a routine evolved that was natural, peaceful, and highly productive. I will miss some aspects of this life when we “return to normal”.

However, I missed the traveling to far away, unknown places, attending scientific conferences, meeting friends and colleagues, and talking to the always young and energetic and eager students and trainees. Talking to the leaders in the world of science, learning first-hand of new techniques, surprising developments, facts destroyed, and knowledge emerge. There is nothing more invigorating than having a coffee, a beer, a dinner, after an exciting scientific session, and discuss the pros and cons, the good and the bad, agree, disagree, fight, come to conclusions, and plan the next set of experiments that will settle it once and forever.

What a privilege it is to be an academic scientist. A life that is made possible thanks to the generosity of our families, friends, and supporters of the HPL, the Faculty of Kinesiology and the University of Calgary. I would like to thank you all for your continued support and dedication in these uncertain times, and your undeterred belief that we can be global leaders in human health, wellness, and performance research.

Sincerely,

Walter Herzog
Director

The Integrative Sensorimotor Neuroscience Laboratory is a growing group in the Human Performance Laboratory. Their work focuses on the mechanistic, multidisciplinary study of human sensorimotor control and learning and understanding how basic aspects of sensory processing contribute. The group combines behavioural experiments with robotics, neurostimulation, medical imaging and computational models to examine the function of the human sensory and motor systems. Ongoing projects in the lab focus on four topics: (1) the role of sensory feedback in the selection, planning and control of voluntary movements; (2) basic principles of sensory processing and how they impact individual patterns of human motor behaviour; (3) probing the function of neural circuits that support motor behaviour and (4) identifying how impairments in sensory and motor function caused by stroke and concussion influence sensorimotor control and learning. With ongoing collaborations, the Integrative Sensorimotor Neuroscience Laboratory hopes to generate tools that allow better assessment, monitoring and diagnoses of deficits in sensory and motor function.

Mechanical fatigue of load-bearing biological tissue is an inevitable consequence of physical activity. Over time, habitual loading of the musculoskeletal system causes microdamage accumulation that reduces the overall quality of the tissue. This leads to a reduction in stiffness and an increase in mechanical strain. Without adequate tissue repair, the evolution and accumulation of microdamage may lead to musculoskeletal injury. Mechanical fatigue is believed to play a predominant role in the pathophysiology of musculoskeletal injuries such as bone stress fracture and achilles and patellar tendinopathy. The research group lead by Dr. Brent Edwards combines biomechanical experimentation with advanced medical imaging and computational modelling to investigate tissue damage and fatigue in response to mechanical loading. This unique approach allows them to estimate in vivo tissue mechanics in a non-invasive and subject-specific manner. Their work spans dimensional scales, from basic experiments at the tissue-level that enhance understanding of the mechanical fatigue process, to applied experiments at the whole-body level for the
development of treatments and interventions to improve tissue quality and decrease risk of injury.

**Salvatore Federico**  
**Continuum Biomechanics Group**

Continuum Mechanics is the study of matter at a length-scale at which the existence of the atomic structure can be neglected, and matter can be treated as continuous rather than discrete. Research in our group is devoted to the mathematical foundations of Continuum Mechanics and its applications to the Biomechanics of Soft Tissue. In particular, we are interested in modelling soft tissue accounting for its structural elements, i.e., collagen fibres, cells, non-fibrous extracellular matrix and fluid. Most phenomena of structural rearrangement in a biological tissue can be described under the umbrella of growth and remodelling. Structural damage is what can initiate injury and disease.

A main theme is the modelling of articular cartilage. Articular cartilage is the thin layer of connective tissue covering the end of bones in our joints: for the span of a lifetime, it provides stress redistribution and an extremely low-friction contact. When the tissue degenerates because of diseases such as osteoarthritis, it cannot perform its function properly and this results in pain, limitation of mobility, and ultimately a decrease in quality of life. Understanding the relationship between the tissue structure and its function, remodelling and damage processes may shed light on the causes of the initiation of degeneration, and suggest possible treatments to prevent disease.

**Reed Ferber**  
**Running Injury Clinic**

Dr. Ferber is a clinical biomechanist and his research is aimed at optimizing rehabilitation and predicting injuries. Overall, his group is engaged in two streams of research: clinical gait analysis and wearable sensors. The group has successfully established an international and growing gait analysis research network currently consisting of 15 researchers and over 125 clinical partners. Each centre is linked to the world’s largest research database of biomechanical gait and clinical data. They are transforming the biomechanics research community by openly...
sharing data between laboratories, employing unique data science analysis methods and growing their research network.

The Running Injury Clinic’s wearable research is based on three challenges: (1) wearable sensors generate a profound amount of data that is largely ignored; (2) the information derived from these sensors is not placed within a contextual narrative and (3) most sensors are designed for activity monitoring and not for healthcare. To address these challenges, Dr. Ferber leads the NSERC Wearable Technology Research and Collaboration (We-TRAC) training program, which builds on being selected by the Vice President – Research to lead the Sensor Technology in Monitoring Movement (STIMM) research program supporting the University’s Eyes High “Engineering Solutions for Health” research strategy.

**WALTER HERZOG**

This past year, Walter Herzog was on administrative leave and used the opportunity to teach, do research and help in the internationalization process of the Federal University of Santa Catarina, Brazil. Two emotions from this experience prevailed: (1) the eagerness of Brazilian students to learn, resulting in hour-long discussions following the formal class hours and (2) the ability of students and faculty members to do excellent research with little or no financial support. At the University of Calgary, five trainees (three postdoctoral fellows, three PhD and one MSc student) finished their research training with him successfully this past year and were able to obtain a faculty position, postdoctoral positions, and employment, respectively.

In the area of muscle mechanics, the Herzog group found the surprising result that the residual force enhancement property was present in muscles whose fibres shortened during contraction, an unexplainable result in the current thinking of muscle mechanics. In the area of joint biomechanics and osteoarthritis they then demonstrated that not only aerobic exercise, but also strength training, is a powerful strategy for preventing knee osteoarthritis in subjects with obesity-related metabolic syndrome. Finally, in their ap-
plied research, the group initiated a clinical collaboration and obtained two small pilot grants, allowing them to test alternative approaches in preserving/restoring muscle function in children with Cerebral Palsy.

**Art Kuo**

Dr. Arthur Kuo’s laboratory studies the biomechanics, energetics and neural control of human movement. They develop computational models of the human body dynamics and apply them to simulations and analyses of locomotion and upper extremity reaching movements. They also perform experiments to test model predictions of stability, motion trajectories and energy expenditure. Ongoing projects include studies of human walking on uneven terrain, use of inertial measurement units to record locomotion in the real world, energetics of human reaching and modeling of neural central pattern generators for locomotion. These projects are intended to reveal basic mechanisms of locomotion and other movements, with applicability to neural rehabilitation and diagnosis of movement impairments.

**Benno M. Nigg & Sandro Nigg**

The Nigg group concentrates on locomotion topics that are health and performance related with special considerations for footwear, apparel and equipment. This last year, (1) significant progress was made in understanding of the influence of lower limb work distribution and footwear design 2) machine learning tools to develop virtual coaching apps were developed and 3) a new concept, the teeter-totter mechanism, to better understand running performance was proposed.

**Lower Limb Work Distribution:**
Running performance decreases throughout a long-distance run. This performance decrease may be due to a decrease in ankle joint work as the run progresses. As a result, knee and hip joint work increases. This year it was demonstrated that work performed by the foot increases throughout a run, which may also reduce long-distance running performance. The application of carbon fibre plates in shoes reduces the work performed by foot joints.
Furthermore, carbon fibre shoes enable runners to maintain a similar amount of ankle joint work longer in a run. In total, shoes with carbon fibre plates may allow runners to maintain performance throughout a long duration run.

Machine Learning and Virtual Coaching: Technological advancements have allowed researchers to collect “on the field” data and provide real time feedback to athletes. In this environment, algorithms were developed which can detect movements of interest and technique level can be automatically distinguished, providing feedback to athletes on their skill level. This year, this process was further automated from an evaluation system to a virtual coaching system by providing specific task feedback (e.g. slow down wrist flexion at ball release) aimed at improving the technique. The results are single sensor solutions that not only provide feedback on an athlete’s skill level, but also deliver specific coaching cues on how to improve their technique.

Teeter-Totter Mechanism: Recent new running shoe developments (e.g. Nike VaporFly) have improved long-distance running performance, as illustrated by many new world records. The new shoes include new materials and unique midsole geometries. However, there is no agreement about the mechanisms responsible for the new record performances. Adding to this discussion, we have proposed that a teeter-totter mechanism is responsible for this improvement in running performance. We are now working on providing experimental evidence that this teeter-totter mechanism is the functional explanation of the effectiveness of these new shoes.

**Ryan Peters**

**Integrative Sensorimotor Neuroscience Laboratory**

Dr. Ryan Peters’ research group investigates the neural basis of human movement using a variety of physiological, behavioural and computational techniques in concert. There are both basic and applied streams of research ongoing in the lab.

Within the basic science stream, Dr. Peters’ research group studies the complex interaction between sensory and motor neurons during voluntary movement. They specialize in microneurography, the only method for directly recording the activity of human somatosensory neurons (muscle spindles, Golgi tendon organs, skin and joint receptors). Currently, they are focused on the functional properties of the muscle spindle’s fusimotor system, which remains poorly understood to-date, particularly in humans.
Within the applied research stream, they are translating basic science into the development of new vibration-emitting wearable technologies for remote neurological assessments, monitoring and therapeutics. Healthy older adults and individuals suffering from neurological disorders (e.g., peripheral neuropathy) experience a decline in somatosensory function which is associated with impairments in manual dexterity and balance. Standard clinical tests of neuropathy are arduous for clinicians and are not well-controlled — vibration-emitting wearable technologies offer a promising alternative approach. The new wearable technologies developed in the Dr. Peters’ lab enable frequent and accurate assessments of neurological function to be performed outside of the clinical setting, which may free up valuable clinician time and improve the quality of patient care.

**Darren Stefanyshyn**

The general research interests of Dr. Stefanyshyn’s group focus on questions related to human locomotion, sport performance and sport injury biomechanics. Their research extends to functional sport equipment with a goal of tuning the properties of the equipment to specific athlete characteristics in order to maximize the athlete’s performance and minimize the risk of injury. Performance research involves developing a basic understanding of the mechanics of human movement during various locomotor and athletic movements. The goal is to determine the mechanical factors dictating an athlete’s performance and how performance can be improved by manipulating these particular factors. In 2020, the group extended it’s industry work on identifying methods of matching sport equipment and footwear to individual athletes. This was accomplished through the investigation of the internal mechanisms using ultrasound imaging that explain an athlete’s response to changes in shoe cushioning material, investigating how foot shape, size and sensitivity influence preferred insole selection and utilizing 3D foot scans and 3D printing to create individualized insoles.

Injury research involves identifying potential injury factors such as global loading characteristics...
associated with ankle and knee sport related injuries as well as developing an understanding of the role played by equipment. This past year valuable insight was gained on the role of sport surface characteristics studying different compositions of infilled artificial turf as well as next generation non-infilled surfaces.

**Exercise Physiology and Nutrition in Health and Sport**

**SAIED JALAL ABOODARDA**  
**EXERCISE NEUROPHYSIOLOGY LABORATORY**

In 2020, Dr. Jalal Aboodarda’s research focused on the integration of physiological and perceptual factors determining exercise tolerance in healthy individuals. Despite COVID-19 setbacks, the team managed to coordinate a large study investigating the kinetics of neuromuscular and perceptual responses to different exercise intensities and durations. In another project, they measured acute corticospinal excitability and inhibition responses to pre-induced fatigue and experimental pain conditions. Neurophysiological responses were quantified using non-invasive techniques such as transcranial magnetic stimulation of the brain and peripheral nerve electrical stimulation of the skeletal muscles.

**PATRICIA K. DOYLE-BAKER**  
**APPLIED PHYSIOLOGY AND PREVENTION THROUGH LIFESTYLE AND EXERCISE**

Dr. Patricia K. Doyle-Baker’s lab focuses on sport science and health and exercise research. Their research, although often at the individual level (i.e., athlete or student) also takes on projects that focus on finding ways to improve the physical activity levels of whole communities (i.e., sport organizations (NSO) or recreation centres). The early part of this past year was disproportionally devoted to designing a 3-year evaluation of a local recreation centre with colleagues from the Built Environment and Health Living Lab within the Department of Community Health Sciences in the Cumming School of Medicine. The evaluation related to an innovative project on children’s play based out of a large recreation centre in Calgary with a goal of transforming the community they interact with. Unfortunately, the COVID-19 pandemic interrupted this research and other lab-based work. The group was able to pivot and investigate the impact the imposed social and physical distancing restrictions had on several population groups including at the community level in North Central Calgary, University Professors, and the Alpine ski race community. They also collaborated with some of the university
librarians and completed a scoping review on stroke in athletes and look forward to sharing the outcomes of this research in the near future.

**JOHN HOLASH**
**EXERCISE PHYSIOLOGY LABORATORY**

The focus of Dr. Holash’s work was continued development and modification of courses and instructional materials within the Exercise Physiology group to leverage new technologies and instruments for course delivery. Dr. Holash represents the faculty on the current “Learning Technologies Advisory Committee” and is part of the Student Orientation Committee with William Bridal for the faculty of Kinesiology. Dr. Holash’s primary role within the faculty is to develop and integrate new advanced teaching and learning techniques and resources for exercise physiology. One of his focuses is to develop a team under the exercise physiology umbrella that hopes to integrate state-of-the-art computer-based methods for measuring, recording and analyzing large data sets of physiological variables. The goal of this team will be to enhance the student experience by providing opportunities for: software product development, rapid prototyping, machine learning, data processing and potentially some entrepreneurship opportunities that revolve around leveraging digital technologies and scaling them. This year Dr. Holash started a research project with an honours student to investigate if virtual reality games, that allow individuals to participate in physical activities and competitions, produce activity levels high enough to make them a viable source of exercise. This type of activity might help provide a bridge for individuals who are unable to gather in groups to still participate together in activities albeit virtually.

**MARTIN MACINNIS**
**EXERCISE AND ENVIRONMENTAL PHYSIOLOGY LABORATORY**

The Metabolic, Exercise, and Environmental Physiology (MEEP) Laboratory is an integrative physiology laboratory interested in understanding how humans respond to acute and chronic exercise and the extent to which these responses are influenced by nutrition, sex and the environment. This research group launched in 2018 and ongoing projects investigate: (1) adaptations in skeletal muscle, cardiovascular and hematological systems to different exercise training programs; (2) the mechanisms underpinning the plasticity of these physiological systems; (3) the development of non-invasive methods to assess
skeletal muscle fitness; (4) the influence of oxygen availability and carbohydrates on aerobic metabolism, neuromuscular fatigue and exercise performance and (5) the use of wearable technologies to improve exercise testing and prescription. They employ a wide breadth of techniques, ranging from the biochemical and molecular analysis of human tissue (e.g., blood and muscle) to whole-body measures of exercise metabolism, tolerance and performance (e.g., pulmonary gas analysis and femoral nerve stimulation). The overall aim of their research program is to understand how molecular and physiological mechanisms regulate physiological systems in humans, with goals to translate and apply this research to improve the health and fitness of individuals ranging from athletes to those with chronic disease and disability.

Nutrition, Metabolism and Genetics

RAYLENE REIMER

Dr. Raylene Reimer’s research focuses on understanding how nutrition and the bacteria that live in our intestine (called gut microbiota) interact to affect our risk of developing chronic diseases such as obesity, type 2 diabetes and fatty liver disease. Changes to the gut microbiota in early life play a particularly strong role in increasing or decreasing the risk of many diseases later in life including obesity and asthma. This year the Reimer lab focused on two aspects of early life microbiota development. In the first instance, they examined changes in the gut microbiota that occur when offspring are born naturally or via Caesarean section. While it is known that C-section birth can increase the risk of certain diseases later in life, Dr. Reimer’s lab further examined how this risk is altered when the mother is lean or has obesity. The second set of experiments examined how fathers’ diet can affect the metabolism of their offspring. While there is ample evidence that maternal diet affects offspring health, they are the first to examine the effect of a father’s diet that is high in protein, high in fibre, or high in fat
and sugar on the health of their offspring. The Reimer lab was also able to make significant progress on one of our human clinical trials until COVID-19 halted the study. This study is examining the potential for prebiotic fibre supplement to reduce pain and improve function in individuals with knee osteoarthritis and obesity. Ultimately the goal is to design and evaluate diets aimed at body weight management and optimal gut microbiota profiles.

**Injury Prevention, Sport Medicine and Rehabilitation**

**AMANDA BLACK**

*The Injury Prevention, Clinical Intervention and Implementation Science Research Group*

The Injury Prevention, Clinical Intervention and Implementation Science Research Group lead by Dr. Amanda Black, is a new group in the Faculty of Kinesiology. Core projects focus on injury surveillance and epidemiology, evidence-based practice and knowledge translation and theory-driven implementation, behaviour change and evaluation. Ongoing projects include: (1) examining the implementation of concussion guidelines, education and management protocols for sporting organizations and high schools and (2) examining the context for implementation for injury prevention initiatives and injury surveillance in high school and university athletic populations.

**CAROLYN EMERY**

*Sport Injury Prevention Research Centre (SIPRC)*

Carolyn Emery is the Chair of the Sport Injury Prevention Research Centre and co-leads the Integrated Concussion Research Program at University of Calgary. Her research focuses on the evaluation of prevention and treatment strategies to reduce the burden of injuries and their consequences in youth sport. Her research has demonstrated that policy disallowing body checking in 15-17 year-old non-elite ice hockey leagues reduces injury rates >60% and concussion rates >50%. Her research also demonstrated a 45% reduction in injury rates in girls with neuromuscular training warm-up program implementation in physical education (ages 11-15). Surveillance in High Schools and Community Sports to Reduce Injuries and their Consequences in Youth Sport (SHRed Injuries) and SHRed Concussions is informing best practice in injury prevention and management across multiple youth sports nationally. The highest concussion rates in youth sport were found in rugby, football, ice hockey and ringette. Targeted
prevention strategies are being evaluated across training (e.g., tackle training), equipment (e.g., helmet fit), and rules of the game (e.g., zero tolerance for head contact). The Alberta Prevention of Early Osteoarthritis (AB PrE-OA) Ankle study examined predictors of post-traumatic OA and demonstrated that youth with a significant ankle joint injury history have more pain and symptoms, poorer function and balance and reduced sport participation and ankle-related quality of life compared to uninjured controls. The AB PrEOA Knee study is evaluating an exercise intervention to prevent post-traumatic knee OA. Dr. Emery’s research also focuses on youth with cerebral palsy, juvenile idiopathic arthritis, and evaluation of adapted physical activity programs.

KATI PASANEN

Dr. Pasanen’s research program focuses on three major areas: (1) identification of risk factors for lower extremity injuries; (2) development of novel methods for training load monitoring using wearable technology and (3) development and evaluation of neuromuscular training programs to decrease the risk of lower extremity injuries in youth sport. Dr. Pasanen is also leading five collaboration studies in Finland – three of them in team sports, one in professional ballet and one in recreational runners. Knowledge generated from this research could ultimately lead to better understanding of causes and mechanisms of lower extremity injuries which could allow us to develop current injury prevention strategies, promote lifelong sport participation and lower the public health care costs related to sport injuries.

KATHRYN SCHNEIDER

CONCUSSION PREVENTION, DETECTION AND REHABILITATION LAB

Dr. Schneider’s lab focuses on the prevention, detection and rehabilitation of concussion with a special interest in the role of the cervical spine and balance systems. They use clinical and technological tests that evaluate multiple different areas of sensory and motor function, ultimately gaining insight into changes that may occur following a concussion and with recovery. Additionally, with the use of technological tests alongside clinical tests, they are gaining a better understanding of how to best evaluate various components of function. Ongoing projects in the lab focus on: (1) the role of neuromuscular training and sensorimotor training in the prevention of concussion; (2) changes in cervical spine, vestibular and sensory function with growth and development; (3) changes in cervical spine,
vestibular and sensory function following a concussion; (4) optimizing assessment rehabilitation techniques to inform diagnosis and enhance recovery from concussion and (5) evaluating implementation of concussion protocols. The program of clinical research involves collaboration with multiple clinicians and researchers across the University of Calgary and other national and international groups, ultimately enabling clinically meaningful questions to be evaluated and translated back to the clinic.

Dr. Smirl’s team is currently leading the exercise-based measures in the Pan-Canadian Surveillance in High Schools to REDuce (SHRed) Concussions project. They are actively collaborating with other Canadian institutions on objectively quantifying the extent concussed athletes rest and exercise following concussions. The build out of the research space for Dr. Smirl’s team was completed in August 2020 and they have spent the remainder of the year brining in new equipment and training so they will be able to perform in person testing in the upcoming year. Through an integrative approach to concussion research and collaboration network, Dr. Smirl’s team aims to create new approaches and interventions which will enable us to objectively assess physiological disruptions following concussion and improve outcomes for individuals following this traumatic injury.

Jonathan Smirl
Cerebrovascular Concussion Research Laboratory

Dr. Jonathan Smirl’s research team works in conjunction with the Sport Injury Prevention Research Centre and the Human Performance Laboratory. His team is focused on understanding the basis of the physiological and autonomic disruptions which occur following concussion. The aim is to use this knowledge base to develop informed interventions (exercise, physiological and pharmacological) which can be used to aid in the recovery process during both the acute and chronic symptom periods.

*Parents’ high anxiety levels linked to less active kids during pandemic.* — Patricia Doyle-Baker
UToday, Brittany DeAngelis. December 18.

*Creating a Flipped Classroom with John Holash.* — John Holash
COVID Coffee Chats @UCalgary Podcast, Mia Anderson. December.

**Tours & Events**

The Human Performance Lab welcomes students into its facilities for tours and events annually. Students from Calgary high schools and programs such as Operation Minerva, IBM STEM4Girls, Shad Valley and Heritage Youth Researchers Summer Program are provided the opportunity to visit various labs in the faculty to learn about science, technology, engineering and mathematics in a university setting. For health reasons, all events were cancelled in 2020.

**Blog Posts**

*Concussion affects 1 in 10 youth athletes every year. Here’s what needs to change.* — Carolyn Emery

*Interested in Concussion CPD? Level up with this #MOOC.* — Kathryn Schneider, Pierre Fremont

Books & Book Chapters

Keynote & Invited Lectures

Doyle-Baker, P. Managing our healthy ‘selves’ is a leadership challenge. Student Wellness Centre Support Staff Retreat, University of Calgary. Calgary, AB. January 7.

Emery, C.A. Students Interested in Medical Sciences (SIMS) Research Symposium, Virtual. October.

Herzog W. Dos and don’ts in an academic scientific career Conference of the International Society for Electrophysiology and Kinesiology. Tokyo, Japan. July 12. (Keynote)

Herzog W. Titin: the forgotten filament in muscle contraction. 10th International Conference on Biomedical Engineering and Technology. Tokyo, Japan, September 15. (Keynote)

Herzog, W. Science is not about papers, it is about people. Neuromechanics Live, Brazilian Society of Biomechanics. Florianopolis, Brazil. July 8.

Herzog, W. Secrets of successful international collaborations. IV Regional Health Innovation Symposium. Urugaiana, Brazil. October, 23.
Keynote & Invited Lectures

Pasanen K. Lower extremity injuries in youth team sports. Can they be predicted? Can they be prevented? Sport Innovation (SPIN) Summit 2020. Own the Podium. For Canada to be a world leader in high performance sport at the Olympic and Paralympic Games. October 22.

Schneider, K. IOC centre meetings. November 5.
